Customer: Inter-Source Recovery Systems Lab No.: 062121
Location: Kalamazoo, MI Date: August 1, 2006
Facility: XXXXXX

Background

A sample of chips was sent to the lab, for moisture analysis, from the system described above. The integrity of the inner bag was good so the sample should be valid. There was no suspicion that the sample had dried out in transit.

Procedures

The basic analysis is to place the pre-weighed chips in the oven to dry. Once removed, the sample is allowed to reach room temperature and is reweighed. The difference in weight is then used to calculate moisture content.

Results

The table below shows the results obtained from the sample.

% Moisture	% Solids
0.15 %	99.85 %

The above information is presented to be true and accurate to the best of our knowledge. It is understood that factors beyond the control of the laboratory will influence the operation.
